The "Cities under Climate Threat: Venice - Philadelphia" exhibition is part of the Center of Excellence on Resilient Cities and Climate-proof Design and Planning activities.

The exhibit focuses on contemporary cities’ urgent issues, such as urbanization, public health, the environment, and climate change. It showcases design experiments for Venice and Philadelphia, two coastal cities heavily impacted by climate change. The interdisciplinary projects bring together research fields related to health, medicine, architecture, and urban planning.

Visitors can see the results of urban redevelopment experiments projected onto large-scale models of the cities, highlighting the expected interrelationships between urban fabric, climate, urbanization, and population health by the year 2050.
